

Paired Delta: SuGaR-Coarse versus STS

Gleiche Konfiguration und gleicher Eval-Split; Delta = SuGaR-Coarse minus STS

Delta = SuGaR-Coarse minus STS for the same follow-up run. The x-label explicitly contains SR or OPENCV, FPS and resolution. For LPIPS, a negative delta favours SuGaR-Coarse because lower LPIPS is better. The paired comparison is only a rendering-stage comparison, not a mesh-accuracy test.
